

SURVIVE

You want to drink water but the river seems to be full of little insects and other trash.

How can you purify water with the materials you find around? Is it possible?

If so, make a 3 minutes (no longer) search on the internet to find the correct materials.

Get in small groups and try to make a simple water purification system by using the materials you collected from the garden or the materials your teacher provides. See which group's design will give the best result.

Compare the purified water obtained from different designs.

Discuss the reasons and alternatives.
